

Standards, Curriculum, Instruction, and Assessment

Standards - What a student needs to know, understand, and be able to do by the end of each grade. Standards build across grade levels in a progression of increasing understanding and through a range of cognitive demand levels. Standards are adopted at the state level by the State Board of Education.

Curriculum - The resources used for teaching and learning the standards. Curricula are adopted at a local level by districts and schools. Curricula include scope and sequence of K-12 standards and/or learning objectives/targets aligned to the state standards. Comprehensive curricula are necessary to plan the pace of instruction, alignment standards and grade level expectations horizontally and vertically, set district assessment and professional development calendars and guide teachers as they deliver instruction.

Instruction - The methods and processes used by teachers in planning, instruction and assessment. Instructional techniques are employed by individual teachers in response to the needs of the students in their classes to help them progress through the curriculum in order to master the standards.

Assessment - The process of gathering information about student learning to inform education-related decisions. Assessments can reflect a wide variety of learning goals/targets using a range of methods serving many important users and uses at a variety of levels from the classroom to the boardroom. In this sense, assessment is an essential part of informing the teaching and learning process.

Innovations for 2018 Science Standards

- 1. Three-Dimensional Learning:** An instructional approach where students make sense of phenomena of the natural world through “engaging in science and engineering practices and their application of the crosscutting concepts” (Bybee pg. 2). The three dimensions work together by reinforcing inner-related concepts, giving students a way of organizing and applying their knowledge across a broad spectrum
- 2. Explaining Phenomena and Designing Solutions to Problems:** Providing a context for lessons, units, and programs that spark students’ curiosity about the phenomena of the natural world and provides a motivation to learn the core ideas of science. The content becomes meaningful, and students are engaged with learning the content to explain the phenomena or to design solutions to a problem.
- 3. Incorporating Engineering Design:** Incorporating engineering design and nature of science are practiced and experienced by students throughout the Arizona Science Standard.
- 4. Building K-12 Progression:** Science engineering practices, crosscutting concepts, and core ideas build coherent learning progressions both within a grade level and across grade levels so students can continually build on and revise their knowledge and skills throughout their schooling.
- 5. Connecting to ELA/literacy and Mathematics:** Literacy and mathematics are part of science. Integrating these disciplines with science provides broad and deep conceptual understanding in all three subject areas.

Arizona's 2018 Science Standards Summary & AzSS vs. NGSS Planning Guide – 8th Grade

While there is some correlation between the 2004 and 2018 science content standards, the 2018 standards encompass many performance objectives in one core idea. The depth and focus of the 2018 standards do not correlate to the 2004 standards well. Therefore, a crosswalk between 2004 and 2018 standards will not be provided.

Why Move Toward Broad Standards and Away from Performance Objectives?

AzSS standards are expectations of student performance. Neuroscience research has identified factors that facilitate effective learning. A relevant finding is that ideas that are connected are more readily used in new situations than unconnected ideas. In other words, a few big ideas enable understanding of the world and our experiences in it, rather than disjointed facts of content (Big Ideas pg. 5).

Moving Toward Broad Standards

- Facts and terminology learned as needed while developing explanations and designing solutions supported by evidence-based arguments and reasoning
- Systems thinking and modeling to explain phenomena and to give a context for the ideas to be learned
- Students conducting investigations, solving problems, and engaging in discussions with teachers' guidance
- Students discussing open-ended questions that focus on the strength of the evidence used to generate claims
- Students reading multiple sources, including science-related magazine and journal articles and web-based resources; students developing summaries of information
- Multiple investigations driven by students' questions with a range of possible outcomes that collectively lead to a deep understanding of established core scientific ideas
- Student writing of journals, reports, posters, and media presentations that explain and argue
- Provision of supports so that all students can engage in sophisticated science and engineering practices

Moving Away from Performance Objectives

- Rote memorization of facts and terminology
- Learning of ideas disconnected from questions about phenomena
- Teachers providing information to the whole class
- Teachers posing questions with only one right answer
- Students reading textbooks and answering questions at the end of the chapter
- Pre-planned outcome for "cookbook" laboratories or hands-on activities
- Worksheets
- Oversimplification of activities for students who are perceived to be less able to do science and engineering

Arizona's 2018 Science Standards Summary & AzSS vs. NGSS Planning Guide – 8th Grade

Three Dimensions of Science

Sense-making in science occurs with the integrating of three essential dimensions: science and engineering practices, crosscutting concepts, and core ideas.

Science and Engineering Practices	Crosscutting Concepts	Core Ideas
<p>Science and engineering practices describe a robust process for how scientists investigate and build models and theories of the natural world or how engineers design and build systems. As students conduct investigations, they engage in multiple practices as they gather information to solve problems, answer their questions, reason about how the data provide evidence to support their understanding, and then communicate their understanding of phenomena. Student investigations may be observational, experimental, use models or simulations, or use data from other sources. These eight practices identified in <i>A Framework for K-12 Science Education</i> are critical components of scientific literacy, not instructional strategies:</p> <ul style="list-style-type: none"> • Asking questions (for science) and defining problems (for engineering) • Developing and using models • Planning and carrying out investigations • Analyzing and interpreting data • Using mathematics and computational thinking • Constructing explanations (for science) and designing solutions (for engineering) • Engaging in argument from evidence • Obtaining, evaluating, and communicating information 	<p>Crosscutting concepts are a tool for students that cross boundaries between science disciplines and provide an organizational framework to connect knowledge from various disciplines into a coherent and scientifically based view of the world. Their purpose is to provide a lens to help students deepen their understanding of the core ideas as they make sense of phenomena. The seven crosscutting concepts identified in <i>A Framework for K-12 Science Education</i> are:</p> <ul style="list-style-type: none"> • Patterns • Cause and effect: Mechanism and explanation • Scale, proportion, and quantity • Systems and system models • Energy and matter: Flow, cycles and conservations • Structure and function • Stability and change 	<p>Core ideas for knowing science and using science develop scientific literacy through science content knowledge, understanding the nature of science, applications of science and engineering, and social implications. The thirteen core ideas modified from <i>Working with Big Ideas of Science Education</i> are:</p> <p>Physical Science</p> <p>P1: All matter in the Universe is made of very small particles. P2: Objects can affect other objects at a distance. P3: Changing the movement of an object requires a net force to be acting on it. P4: The total amount of energy in a closed system is always the same but can be transferred from one energy store to another during an event.</p> <p>Earth and Space Science</p> <p>E1: The composition of the Earth and its atmosphere and the natural and human processes occurring within them shape the Earth's surface and its climate. E2: The Earth and our solar system are a very small part of one of many galaxies within the Universe.</p> <p>Life Science</p> <p>L1: Organisms are organized on a cellular basis and have a finite life span. L2: Organisms require a supply of energy and materials for which they often depend on, or compete with, other organisms. L3: Genetic information is passed down from one generation of organisms to another. L4: The unity and diversity of organisms, living and extinct, is the result of evolution.</p> <p>Using Science</p> <p>U1: Scientists explain phenomena using evidence obtained from observations and or scientific investigations. Evidence may lead to developing models and or theories to make sense of phenomena. As new evidence is discovered, models and theories can be revised. U2: The knowledge produced by science is used in engineering and technologies to solve problems and/or create products. U3: Applications of science often have both positive and negative ethical, social, economic, and/or political implications.</p>

The intention of this document is to help Arizona educators determine if a Next Generation Science Standard (NGSS) resource could be used when planning for instruction with the Arizona Science Standards (AzSS). This document describes how the Arizona Science Standards may or may not align to the Next Generation Science Standards.

8th Grade Arizona Science Standards (AzSS) Alignment to Next Generation Science Standards (NGSS)

The ADE acknowledges that the acronym “NGSS” is consistently used throughout science resources. To avoid confusion, we want to ensure the community understands that Arizona is not considered an “NGSS” state. To further clarify, AzSS and the NGSS were both designed using the research document *A Framework for K-12 Science Education*. Both documents include a strong focus on three-dimensional instruction, which includes: Science and Engineering Practices, Crosscutting Concepts, and Core Ideas. The major difference between the AzSS and the NGSS is that Arizona used an additional research document, *Working with Big Ideas of Science Education*, in the development of the Core Ideas of Knowing and Using Science.

Alignment of the AzSS to NGSS Performance Expectations

Note: An “S” or “P” alignment indicates that an NGSS resources could be used. An “NC” indicates that an NGSS resources cannot be used.

- **S = Strong:** Both the Core Idea and Science and Engineering Practice (SEP*) are the same
- **P = Partial:** Core idea is closely related; SEP may or may not match
- **NC** = Not Closely Correlated:** There is no strong or partial correlation in this grade band

**The bolded section of each standard refers to the Science and Engineering Practice that correlates to each standard. However, others should be utilized throughout the learning for this grade level. Naturally one practice can lead to the use of others.*

***The NGSS performance expectation may be in a different grade level.*

Crosscutting Concepts: Patterns; **Cause and Effect**; Scale, Proportion and Quantity; Systems and System Models; **Energy and Matter**; Structure and Function; **Stability and Change**

**Bolded crosscutting concepts are a focus throughout this grade level.*

Physical Science: Students apply stability and change to explore chemical properties of matter and chemical reactions to further understand energy and matter.

Arizona Science Standards- 8 th Grade Physical		Next Generation Science Standards- 8 th Grade Physical
8.P1U1.1 Develop and use a model to demonstrate that atoms and molecules can be combined or rearranged in chemical reactions to form new compounds with the total number of each type of atom conserved.	S	MS-PS1-5 Develop and use a model to describe how the total number of atoms does not change in a chemical reaction and thus mass is conserved.
8.P1U1.2 Obtain and evaluate information regarding how scientists identify substances based on unique physical and chemical properties.	NC	There is no strong or partial correlation to an NGSS standard in this grade band.
8.P4U1.3 Construct an explanation on how energy can be transferred from one energy store to another.	NC	There is no strong or partial correlation to an NGSS standard in this grade band.

Arizona's 2018 Science Standards Summary & AzSS vs. NGSS Planning Guide – 8th Grade

Arizona Science Standards- 8 th Physical		Next Generation Science Standards- 8 th Physical
8.P4U1.4 Develop and use mathematical models to explain wave characteristics and interactions.	S	MS-PS4-1 Use mathematical representations to describe a simple model for waves that includes how the amplitude of a wave is related to the energy in a wave.
	S	MS-PS4-2 Develop and use a model to describe that waves are reflected, absorbed, or transmitted through various materials.
8.P4U2.5 Develop a solution to increase efficiency when transferring energy from one source to another.	P	MS-PS3-3 Apply scientific principles to design, construct, and test a device that either minimizes or maximizes thermal energy transfer.

Earth and Space Standards: Students explore natural and human-induced cause-and-effect changes in Earth systems over time.

Arizona Science Standards- 8 th Grade Earth & Space		Next Generation Science Standards- 8 th Grade Earth & Space
8.E1U1.6 Analyze and interpret data about the Earth's geological column to communicate relative ages of rock layers and fossils.	P	MS-ESS1-4 Construct a scientific explanation based on evidence from rock strata for how the geologic time scale is used to organize Earth's 4.6-billion-year-old history.
	P	MS-LS4-1 Analyze and interpret data for patterns in the fossil record that document the existence, diversity, extinction, and change of life forms throughout the history of life on Earth under the assumption that natural laws operate today as in the past.
8.E1U3.7 Obtain, evaluate, and communicate information about data and historical patterns to predict natural hazards and other geological events.	P	MS-ESS3-2 Analyze and interpret data on natural hazards to forecast future catastrophic events and inform the development of technologies to mitigate their effects.
8.E1U3.8 Construct and support an argument about how human consumption of limited resources impacts the biosphere.	S	MS-ESS3-4 Construct an argument supported by evidence for how increases in human population and per-capita consumption of natural resources impact Earth's systems.

The intention of this document is to help Arizona educators determine if a Next Generation Science Standard (NGSS) resource could be used when planning for instruction with the Arizona Science Standards (AzSS). This document describes how the Arizona Science Standards may or may not align to the Next Generation Science Standards.

Arizona's 2018 Science Standards Summary & AzSS vs. NGSS Planning Guide – 8th Grade

Life Science Standards: Students develop an understanding of patterns and how genetic information is passed from generation to generation. They also develop an understanding of how traits within populations change over time.

Arizona Science Standards- 8 th Grade Life		Next Generation Science Standards- 8 th Grade Life
8.L3U1.9 Construct an explanation of how genetic variations occur in offspring through the inheritance of traits or through mutations.	P	MS-LS3-2 Develop and use a model to describe why asexual reproduction results in offspring with identical genetic information and sexual reproduction results in offspring with genetic variation.
8.L3U3.10 Communicate how advancements in technology have furthered the field of genetic research and use evidence to support an argument about the positive and negative effects of genetic research on human lives.	P	MS-LS4-5 Gather and synthesize information about technologies that have changed the way humans influence the inheritance of desired traits in organisms.
8.L4U1.11 Develop and use a model to explain how natural selection may lead to increases and decreases of specific traits in populations over time.	P	MS-LS4-6 Use mathematical representations to support explanations of how natural selection may lead to increases and decreases of specific traits in populations over time.
8.L4U1.12 Gather and communicate evidence on how the process of natural selection provides an explanation of how new species can evolve.	P	MS-LS4-4 Construct an explanation based on evidence that describes how genetic variations of traits in a population increase some individuals' probability of surviving and reproducing in a specific environment.

The intention of this document is to help Arizona educators determine if a Next Generation Science Standard (NGSS) resource could be used when planning for instruction with the Arizona Science Standards (AzSS). This document describes how the Arizona Science Standards may or may not align to the Next Generation Science Standards.
