## Introduction

The Multi-State Alternate Assessment (MSAA) is a summative assessment system designed to promote increasingly higher academic outcomes for students with the most significant disabilities to prepare them for a broader array of post-secondary outcomes. The MSAA is designed to measure grade-level academic content that is aligned with, and derived from, MSAA Partner States' content standards. The MSAA is administered in the areas of English language arts (ELA) and mathematics in grades 3-8 and 11.

The impact of COVID-19 worldwide resulted in cancellation of the 2020 administration and continued to influence many MSAA Partner States' participation levels in 2021. Given the continued pandemic-related disruptions to the 2021 administration of the MSAA assessments, concerns have been raised about the effects on student test scores and achievement. Some researchers suggested a longitudinal approach to analyzing assessment data as a means of evaluating the potential effects of pandemic-related disruptions (An et. Al, 2022).

This report details the results of a study that Cognia conducted to examine the potential effects of pandemicrelated disruptions to 2021 student performance on MSAA assessments. Cognia used MSAA ELA and mathematics assessment data from the 2017, 2019, and 2021 administration years to calculate three test-score metrics from Ho (2021) to detect any systematic impacts on student participation and test performance that might have stemmed from pandemic-related disruptions. Student performance data from 2017, and not 2018, was utilized to mirror the two-year gap between the 2019 and 2021 test administrations.

The MSAA Partner States that participated in all three assessment administrations years include Arizona, Maine, Montana, The Marianas (the Commonwealth of the Northern Mariana Islands), South Dakota, Tennessee, and the U.S. Virgin Islands. Note that while Washington, D.C. was one of the partners stated during the three assessment years, they did not administer the assessment in 2021 and are therefore not included in this report. Additionally, Guam was not included, because the student IDs of Guam students were not consistent (within student) across the 2017, 2019, and 2021 administrations. Also note that due to the gap between grades 8 and 11, the MSAA ELA and mathematics grade 11 assessment was not included in the analyses.

The next section of this report details the calculation of the match rates, fair trends, and equity checks test-score metrics. Then, participation counts, scaled score descriptive statistics, performance level distributions, and the results from each test-score metric are provided. This report also includes several appendices containing supporting details from these results.

## Method

To address the overarching research question, i.e., to what extend did pandemic-related disruptions impact 2021 student performance on MSAA assessments, several sets of analyses were conducted. To begin, descriptive analyses related to student participation and performance on MSAA assessments were performed. The next set of analyses were based on three test score metrics (i.e., match rate, fair trend, and equity checks). More details on the specific methods related to each of the three metrics are provided below.

## Test Score Metrics

Ho (2021) proposed three metrics for reporting test scores during COVID-19 which were labelled as match rate, fair trend, and equity check. Cognia adopted these metrics in this COVID-19 follow-up impact study. Brief descriptions that include the purpose, definition, and computation of each of the three metrics as they relate to the MSAA COVID-19 follow-up impact study are presented below. For additional details related to the three test-score metrics, please refer to Ho (2021).

Calculation of the test-score metrics-match rate, fair trend, equity check-rely on the student results data from the 2017, 2019, and 2021 of the MSAA ELA and Mathematics assessments. The details of the test-score metrics presented below rely on the notation defined in Table 1.

Table 1. Listing of Symbols and Definitions

| Symbol | Definition |
| :---: | :---: |
| Administration Year |  |
| $y$ | 2021, the current administration year |
| $y-2$ | 2019 the previous administration year (two years prior to the current administration year) |
| $y-4$ | 2017, four years prior to the current administration year |
| MSAA Assessment Grade Level |  |
| $g$ | assessment grade-level $5,6,7$, or 8 |
| $g-2$ | assessment grade-level $3,4,5$, or 6 |
| Student Participation Frequencies |  |
| $N_{y-2, g-2}$ | Number of students who tested in grade $g-2$ in 2019 (year $y-2$ ) |
| $N_{y-4, g-2}$ | Number of students who tested in grade $g-2$ in 2017 (year $y-4$ ) |
| $N_{y, g}^{*}$ | Number of students who tested in grade $g$ in 2021 (year $y$ ) and in grade $g-2$ in 2019 (year $y-2$ ) |
| $N_{y-2, g}^{*}$ | Number of students who tested in grade $g$ in 2019 (year $y-2$ ) and in grade $g-2$ in 2017 (year $y-4$ ) |
| Observed Scaled Scores |  |
| $X_{y, g}$ | Observed scaled score in 2021 (year $y$ ) in grade $g$ |
| $X_{y-2, g}$ | Observed scaled score in 2019 (year $y-2$ ) in grade $g$ |
| $X_{y-2, g-2}$ | Observed scaled score in 2019 (year $y-2$ ) in grade $g$ |
| $X_{y-4, g-2}$ | Observed scaled score in 2021 (year $y$ ) in grade $g$ |
| Matched Scaled Scores |  |
| $X_{y, g}^{*}$ | Observed 2021 (year $y$ ) scaled score in grade $g$ of a student who tested in grade $g$ in 2021 (year $y$ ) and in grade $g$ - 2 in 2019 |

| Symbol | Definition |
| :---: | :---: |
| $X_{y-2, g}^{*}$ | Observed 2019 (year $y-2$ ) scaled score in grade $g$ of a student who tested in grade $g$ in 2019 (year $y-2$ ) and in grade $g-2$ in 2017 (year $y-4$ ) |
| $X_{y-4, g-2}^{*}$ | Observed 2017 (year $y-4$ ) scaled score in grade $g-2$ of a student who tested in grade $g$ in 2019 (year $y-$ 2) and in grade $g-2$ in 2017 (year $y-4$ ) |
| $\hat{X}_{y-2, g}^{*}$ | Predicted 2019 (year $y-2$ ) scaled score in grade $g$ |
| Non-Matched Scaled Scores |  |
| $X_{y-2, g-2}^{\prime}$ | Observed 2019 (year $y-2$ ) scaled score in grade $g-2$ of a student who tested in grade $g-2$ in 2019 (year $y-2$ ) but did not test grade $g$ in 2021 (year $y$ ) |
| $\hat{X}_{y-2, g}^{\prime}$ | Predicted 2019 (year $y-2$ ) scaled score in grade $g$ of a student who tested in grade $g-2$ in 2019 (year $y-$ 2) but did not test grade $g$ in 2021 (year $y$ ) |

## Match Rate

The match rate is the percentage of students who tested in the previous grade of the previous administration who also tested in the current grade of the current administration. The current study examines the 2019 and the 2021 match rates, each separately for MSAA ELA and Mathematics.

As shown in Table 2, the 2019 match rates treat the current administration as the 2019 administration of MSAA and the previous administration as the 2017 administration of MSAA. Similarly, the 2021 match rates define the current administration as the 2021 administration of MSAA and the previous administration as the 2019 administration of MSAA.

Table 2. Administration Years and MSAA Assessment Grade Levels for 2019 and 2021 Match Rates

| MSAA Administration Year |  | MSAA Grade Level |  |
| :---: | :---: | :---: | :---: |
| Current | Previous | Current | Previous |
| 2019 Match Rates |  |  |  |
| 2019 | 2017 | Grade 5 | Grade 3 |
| 2019 | 2017 | Grade 6 | Grade 4 |
| 2019 | 2017 | Grade 7 | Grade 5 |
| 2019 | 2017 | Grade 8 | Grade 6 |
| 2021 Match Rates |  |  |  |
| 2021 | 2019 | Grade 5 | Grade 3 |
| 2021 | 2019 | Grade 6 | Grade 4 |
| 2021 | 2019 | Grade 7 | Grade 5 |
| 2021 | 2019 | Grade 8 | Grade 6 |

For a given assessment (MSAA ELA or MSAA Mathematics) and a given pairing of current grade and previous grade tested, the 2019 and 2021 match rates are given by

$$
2019 \text { Match Rate }=100 \times N_{y-2, g}^{*} / N_{y-4, g-2}
$$

and

$$
2021 \text { Match Rate }=100 \times N_{y, g}^{*} / N_{y-2, g-2},
$$

where $y=2021$,
$y-2=2019$,
$y-4=2017$,
$g=5,6,7$, or 8 , and
$g-2=3,4,5$, or 6 .

## Fair Trend

The focus of the fair trend analysis is a set of comparisons between student observed scaled scores from the 2021 administration of a given current grade with their predicted (or fair trend adjusted) scaled scores from the 2019 administration, had those students in 2021 tested in the same grade in 2019. For example, the comparison for MSAA ELA grade 5 was based on the observed 2021 scaled scores of students from the 2021 administration of MSAA ELA grade 5 and the predicted 2019 scaled scores of those same students, had they also taken the MSAA ELA grade 5 in 2019.

Each comparison of 2021 observed scaled scores with 2019 predicted scaled scores was a within-group comparison of two sets of scaled scores (one observed, the other predicted), with both sets of scaled scores being on the reporting scale of the same MSAA assessment (e.g., MSAA Mathematics Grade 7). The group in each comparison is the matched set of students who tested in 2021, in a subject (MSAA ELA or Mathematics) and grade $g$ who also tested in 2019 in the same subject in grade $g-2$.

The fair trend analysis for each MSAA subject (ELA or Mathematics) and each pairing of current and previous grades was performed via the following steps:

1. Identify the set of students who tested in 2019 in grade $g$.
2. Identify the subset of those students, who also tested in 2017 in the previous grade $g-2$.
3. Using that subset of students testing in 2017 and 2019 , fit the following linear regression model that predicts 2019 scaled scores in grade $g$ from 2017 scaled scores in grade $g-2$ :

$$
X_{y-2, g}^{*}=\beta_{0}+\beta_{1} X_{y-4, g-2}^{*}+\varepsilon
$$

where $\beta_{0}$ is an intercept parameter,
$\beta_{1}$ is a slope parameter, and and $\varepsilon$ is an error term.
4. Identify the subset of students who tested in 2021 in grade $g$ who also tested in 2019 in the associated previous grade $g-2$.
5. For each student who tested in 2019 and 2021, calculate $\hat{X}_{y-2, g}^{*}$, the predicted 2019 scaled score in grade $g$ from the observed 2019 scaled scores in the previous grade $g-2$, where

$$
\hat{X}_{y-2, g}^{*}=\beta_{0}+\beta_{1} X_{y-2, g-2}^{*}
$$

6. Calculate the unstandardized mean difference, $\mu_{d}$, between the observed 2021 scaled scores in grade $g$ and predicted 2019 scaled score in grade $g$, i.e.,

$$
\mu_{d}=\mu\left(X_{y, g}^{*}\right)-\mu\left(\hat{X}_{y-2, g}^{*}\right),
$$

where $\mu(\cdot)$ is the mean value of the given variable.
$\mu_{d}$ represents the average difference in scaled scores points between the observed 2021 grade $g$ scaled scores and the predicted 2019 grade $g$ scaled scores.
7. Calculate the standardized mean difference, $\delta$, by dividing the unstandardized mean difference by $S_{y, g}^{*}$, the standard deviation of the 2021 observed scaled scores in grade $g$ (for students who tested in 2019 and 2021), i.e.,

$$
\delta=\frac{\mu_{d}}{S_{y, g}^{*}}
$$

$\delta$ represents the number of ( 2021 grade- $g$ ) scaled score standard deviations by which the mean observed 2021 grade $g$ scaled score differs from the mean predicted 2019 grade $g$ scaled score.

When interpretating standardized mean differences, Cohen (1988) recommends the following intervals:

- Negligible effect: $0 \leq|\delta|<0.2$
- Small effect: $0.2 \leq|\delta|<0.5$
- Medium effect: $0.5 \leq|\delta|<0.8$
- Large effect: $|\delta| \geq 0.8$

## Equity Check

The equity check is a comparison between (a) the students who tested in 2019 in grade $g-2$ and in 2021 in grade $g$, versus (b) the students who tested in 2019 in grade $g-2$ but did not test in 2021 in grade $g$. That is, the matched students from 2019 are compared with the unmatched students from 2019. For each unmatched student, a predicted 2019 scaled score in grade $g$ is estimated based on the student's observed 2019 scaled score in grade $g-2$. The mean predicted 2019 scaled score, in grade $g$ among unmatched students, is compared against the mean observed 2021 scaled scores in grade $g$ among matched students.

The equity check calculations are as follows:

1. Identify the set of students who tested in 2019 in grade $g-2$.
2. Identify a subset of those students who tested in 2019 but did not test in 2021.
3. For each student in that subset who tested in 2019 and but did not test in 2021, calculate $\widehat{X}_{y-2, g}^{\prime}$, the predicted 2019 scaled score in grade $g$ from the observed 2019 scaled score in the previous grade $g-2$, using the same slope and intercept parameter estimates previously obtained as part of the fair trend analyses. That is,

$$
\hat{X}_{y-2, g}^{\prime}=\beta_{0}+\beta_{1} X_{y-2, g-2}^{\prime}
$$

4. Calculate the unstandardized mean difference, $\mu_{d}^{\prime}$, between the observed 2021 scaled scores in grade $g$ for students who tested in 2019 and 2021 versus the predicted 2019 scaled scores in grade $g$ for students who tested in 2019 but not in 2021, such that

$$
\mu_{d}^{\prime}=\mu\left(X_{y, g}^{*}\right)-\mu\left(\hat{X}_{y-2, g}^{\prime}\right)
$$

$\mu_{d}^{\prime}$ represents the average difference in scaled scores points between the observed 2021 grade $g$ scaled scores and the predicted 2019 grade $g$ scaled scores of those testing in 2019, but not in 2021.
5. Calculate the standardized mean difference, $\delta^{\prime}$, by dividing the unstandardized mean difference by $S_{\text {pooled }}$, the pooled standard deviation of $X_{y, g}^{*}$ and $\hat{X}_{y-2, g}^{\prime}$, such that

$$
\delta^{\prime}=\frac{\mu_{d}}{S_{\text {pooled }}},
$$

where

$$
S_{\text {pooled }}=\sqrt{\frac{\left(N_{y, g}^{*}-1\right) S_{X_{y, g}^{*}}^{2}+\left(N_{y-2, g-2}^{\prime}-1\right) S_{X_{y-2, g}^{\prime}}^{2}}{N_{y, g}^{\prime}+N_{y-2, g-2}^{\prime}-2}} .
$$

$\delta^{\prime}$ represents the number of pooled standard deviations by which the mean observed 2021 grade $g$ scaled score of students who tested in 2019 and 2021, differs from the mean predicted 2019 grade $g$ scaled score of students who tested in 2019 but not in 2021.

## Results

The following section of the report presents results based on the analyses conducted as described in the methods section, starting with relevant descriptive statistics. This is followed by analysis results for the three test score metrics (i.e., match rates, fair trends, and equity checks). Note that, where relevant, results are presented for three assessment administration years (2017, 2019, and 2021) for both ELA and Mathematics.

## Descriptive Statistics

Results based on MSAA administration participation rates are presented first. Next, descriptive statistics related to student performance and assessment performance levels are presented. For additional details related to participation and performance on MSSA assessments, please refer to the annual MSSA technical reports.

## Participation Rates

This section presents descriptive results related to student participation numbers on MSAA administrations for 2017, 2019, and 2021 across two subjects and six grades. Tables 3 through Table 8 show the disaggregated student participation rates on MSAA administrations as a function of grade for ELA and Mathematics in 2017, 2019, and 2021, respectively. The complete set of participation rate tables disaggregated by partner, subject, grade, student groups and subgroups are available in Appendix A.

Overall student participation numbers in 2017 for ELA (see Table 3) range from 2,153 to 2,566 across grades 3 through 8. In the same year, student participation numbers for Mathematics (see Table 4) range from 2,162 for grade 3 to 2,572 for grade 8 . As shown in the Tables 2 and 3 , the participation numbers for both the 2017 ELA and Mathematics subjects are consistent across student groups and subgroups.

Similarly, the overall student participation numbers in 2019 for ELA (see Table 5) range from 2,056 to 2,423 across grades 3 through 8, and participation numbers for Mathematics (see Table 6) range from 2,063 for grade 3 to 2,427 for grade 8 . The participation numbers are consistent across student groups and subgroups between the two subjects. There are no notable differences in student participation numbers between the 2017 and 2019 assessment years.

In 2021, as shown in Table 7 and Table 8, the overall student participation numbers for ELA range from 1,666 in grade 3 to 2,105 in grade 8 , while participation for Mathematics range from 1,762 to 2,107 across the same grades. Thus, there is a notable decline in participation between 2017 / 2019 and the 2021 MSAA assessment years. For both ELA and Mathematics, the percentage decrease in student participation numbers between the 2019 and 2021 assessment years range from approximately $13 \%$ to $20 \%$.

Table 3. Disaggregated Student Participation Rates for the 2017 Administration of MSAA ELA, as a Function of Grade

| Subgroup Variable | Subgroup Value | Grade 3 | Grade 4 | Grade 5 | Grade 6 | Grade 7 | Grade $8$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Scaled Score Descriptive Statistics

This section presents descriptive results related the scaled score means and standard deviations on MSAA assessments. Table 9 summarizes the disaggregated scaled score means and standard deviations for MSAA ELA, as a function of administration year, partner, and grade. While Table 10 shows the same information for MSAA Math. We also calculated and compared the scaled score means and standard deviations of MSAA assessments by MSAA partner disaggregated by student groups and subgroups (See Appendix B). In addition, histograms of scaled score distributions are presented in Appendix C.

As shown in Table 9, the overall scaled score means in 2017 for ELA range from 1238.35 to 1242.76 across grades 3 through 8. In the same year, scaled score means for Mathematics range from 1239.97 to 1243.26 across the same grades. Similarly, the overall scaled score means in 2019 for ELA range from 1237.70 to 1242.70 across grades 3 through 8, and scaled score means for Mathematics range from 1238.42 to 1241.96. The scaled score means and standard deviations are relatively consistent across student groups and subgroups between the two subjects. The overall scaled score means based on the 2021 administration year for ELA range from $1236.39(S D=11.78)$ to $1241.18(S D=12.81)$, while scaled score means for Mathematics range from $1239.22(S D=11.22)$ to $1240.98(S D=12.73)$.

## Performance Level Statistics

Table 11 through Table 16 summarizes the overall performance level percentage distributions for the 2017, 2019, and 2021 administration of MSAA ELA and Mathematics, as a function of grade and partner. The full set of disaggregated performance level percentage distributions is available in Appendix $D$.
Table 11. Performance Level Percentage Distribution for the 2017 Administration of MSAA ELA, as a
Function of Grade and Partner

| Grade | Partner | Level 1 | Level 2 | Level 3 | Level 4 |

## Test-Score Metrics

## Match rates

Table 17 shows the overall match rates on 2019 MSAA assessments by subject and as a function of MSAA partner, while Table 18 gives the same results based on the 2021 MSAA assessments. Recall that the match rates serve as an indicator of student attrition between two years of test administrations. The 2019 match rates characterize typical attrition for MSAA assessments, serving as a reference point for the 2021 pandemic-impacted match rates. Note that tables showing the match rates disaggregated by subject and grade, as well as student subgroups, are available in Appendix E.

In general, the match rate trends for 2019 vs. 2021 mimic those of participation numbers for ELA and Mathematics. Overall, the 2021 match rates for both ELA and Mathematics show an 8 to 10-point decline compared to the 2019 match rates. However, these match rate trends varied considerably across partners with the following notable results:

Partner MP showed a 3 to 5-point increase for ELA grades 5 and 7, as well as Mathematics grade 7. In addition, there is an approximate 28-point increase for ELA and Mathematics in grade 6. Also, there is a 32-point decrease for ELA and Mathematics in grade 8.

Partner SD shows a 6 to 15-point increase across all grades for ELA and Mathematics. While partner VI shows no change for ELA grade 7, but a substantial $3-66$-point decrease across all other grades for both subjects. The decline for grades 5 and 6 for both ELA and Mathematics are in the 30 to 40-point range, while grade 8 for ELA and Mathematics show the biggest decrease (66.7\%) across all partners.

Table 17. MSAA 2019 Overall Match Rates, as a Function of Partner

| Subject | Admin. Year | Prior Admin. Year | Grade Tested | Prior Grade Tested | Overall | AZ | ME | MP | MT | SD | TN | VI |

Table 19. MSAA 2019 and 2021 Overall Match Rates, as a Function of Subject and Grade

| Subject | Grade Tested | Prior Grade Tested | 2019 Match Rate | 2021 Match Rate | Difference in Match Rate |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ELA | 05 | 03 | $73.1 \%$ | $65.1 \%$ | $-8.0 \%$ |
| ELA | 06 | 04 | $73.0 \%$ | $64.1 \%$ | $-8.9 \%$ |
| ELA | 07 | 05 | $74.1 \%$ | $64.5 \%$ | $-9.6 \%$ |
| ELA | 08 | 06 | $74.9 \%$ | $67.4 \%$ | $-7.5 \%$ |
| Mathematics | 05 | 03 | $73.2 \%$ | $64.8 \%$ | $-8.5 \%$ |
| Mathematics | 06 | 04 | $73.0 \%$ | $63.9 \%$ | $-9.1 \%$ |
| Mathematics | 07 | 05 | $74.0 \%$ | $64.1 \%$ | $-9.8 \%$ |
| Mathematics | 08 | 06 | $74.9 \%$ | $67.3 \%$ | $-7.6 \%$ |

## Fair Trends

Overall MSAA Fair Trend results by subject and grade are given in Table 20. Additionally, tables showing fair trend results for each grade and subject disaggregated by partner are available in Appendix F. Recall that the focus of the fair trend analysis is a set of comparisons between student observed scaled scores from the 2021 administration of a given current grade with their predicted (or fair trend adjusted) scaled scores from the 2019 administration, had those students in 2021 tested in the same grade in 2019. For example, the comparison for MSAA ELA grade 5 is based on the observed 2021 scaled scores of students from the 2021 administration of MSAA ELA grade 5 and the predicted 2019 scaled scores of those same students, had they also taken the MSAA ELA grade 5 in 2019.

Overall, the fair trend analyses result in small to near-zero effect sizes. The largest trend occurred in ELA grade 6, which resulted in an effect size of -0.27 . The next highest effect sizes occur in Mathematics grade 8 and grade 6 with effect sizes of -0.13 and -0.12 , respectively.
Table 20. MSAA Fair Trend Results, as a Function of Subject and Grade

| Subject | Grade | Number of Students | Mean 2021 Observed Scaled Score | SD 2021 <br> Observed Scaled Score | Fair Trend Adj. Mean Scaled Score | Fair Trend Adj. SD Scaled Score | Mean Difference | $\begin{aligned} & \text { Effect } \\ & \text { Size } \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ELA | 05 | 1,338 | 1237.70 | 11.89 | 1238.37 | 7.35 | -0.67 | -0.06 |
| ELA | 06 | 1,420 | 1235.42 | 11.51 | 1238.55 | 5.95 | -3.13 | -0.27 |
| ELA | 07 | 1,508 | 1240.47 | 12.58 | 1241.39 | 6.87 | -0.93 | -0.07 |
| ELA | 08 | 1,567 | 1237.27 | 10.85 | 1238.29 | 5.92 | -1.02 | -0.09 |
| Mathematics | 05 | 1,336 | 1239.21 | 11.10 | 1239.74 | 4.80 | -0.53 | -0.05 |
| Mathematics | 06 | 1,418 | 1239.54 | 10.79 | 1240.85 | 3.76 | -1.32 | -0.12 |
| Mathematics | 07 | 1,503 | 1240.08 | 12.62 | 1241.20 | 4.41 | -1.12 | -0.09 |
| Mathematics | 08 | 1,566 | 1240.54 | 11.73 | 1242.05 | 5.53 | -1.51 | -0.13 |

## Equity Checks

Overall MSAA Equity Check results (as a function of subject and grade) are listed in Table 21, and the complete set of tables showing the same information for each grade and subject disaggregated by partner and student groups is presented in Appendix G. As a reminder, the equity check analyses compare matched students (students who tested in both 2019 and 2021) with unmatched students (students who tested in 2019 but not in 2021). For the unmatched students, predicted scaled scores are estimated based on the students' observed 2019 scaled scores. The mean predicted scaled scores among unmatched students is compared against the mean observed 2021 scaled scores among matched students.

As shown in Table 21, the missing students adjusted mean scale scores are similar to the fair trend adjusted mean scale scores. On average, the means for the missing (unmatched) students are greater than the means of the matched students. However, the differences are mostly in the same direction and are all less than 1 scale score point. Additionally, the analyses result in small to near-zero effect sizes ranging from 0.06 (Mathematics,
grade 7) to -0.12 (ELA, grade 8). Notable results include ELA, grade 8 with an effect size of -0.12 and a mean difference of -0.75 . Similarly, ELA (grade 6 ) results in an effect size of -0.11 with a mean difference of -0.66 .
Table 21. MSAA Equity Check Results, as a Function of Subject and Grade

| Subject | Grade | Number Matched | Fair <br> Trend Adj. Mean Scaled Score | Fair <br> Trend Adj. SD Scaled Score | Number Missing | Missing Students Adj. Mean Scaled Score | Missing Students Adj. SD Scaled Score | Mean Difference | $\begin{gathered} \text { Pooled } \\ \text { SD } \end{gathered}$ | $\begin{aligned} & \text { Effect } \\ & \text { Size } \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ELA | 5 | 1,338 | 1238.37 | 7.35 | 718 | 1239.03 | 8.19 | -0.66 | 7.65 | -0.09 |
| ELA | 6 | 1,420 | 1238.55 | 5.95 | 796 | 1239.21 | 6.32 | -0.66 | 6.09 | -0.11 |
| ELA | 7 | 1,508 | 1241.39 | 6.87 | 829 | 1241.37 | 7.48 | 0.02 | 7.09 | 0.00 |
| ELA | 8 | 1,567 | 1238.29 | 5.92 | 759 | 1239.04 | 6.94 | -0.75 | 6.27 | -0.12 |
| Mathematics | 5 | 1,336 | 1239.74 | 4.80 | 727 | 1240.13 | 5.28 | -0.39 | 4.98 | -0.08 |
| Mathematics | 6 | 1,418 | 1240.85 | 3.76 | 801 | 1240.97 | 4.10 | -0.11 | 3.89 | -0.03 |
| Mathematics | 7 | 1,503 | 1241.20 | 4.41 | 840 | 1240.95 | 4.27 | 0.25 | 4.36 | 0.06 |
| Mathematics | 8 | 1,566 | 1242.05 | 5.53 | 761 | 1242.12 | 5.72 | -0.07 | 5.59 | -0.01 |
